The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, clearly at the or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a compound that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of pain, and a pharmaceutical composition of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of polypeptides or their antibodies. The polynucleotide or the compound that composition is useful for preparing a medicament for treating pain and a pharmaceutical nerve injury (CNung), chronic constriction or injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at the printed specification at the pain and the printed contributed the printed specification at the printed specif

                                                                                                                                                                                                                                                                                                                                 modulator. The modulator may have cytostatic, antithyroid, antidiabetic or ophthalmological activity. The method is useful for treating a subject having a tumourigenic or angiogenic disorder, in particular for treating cancer (for example breast cancer, colon cancer, lung cancer or prostatic cancer) and, for example, Grave's disease and diabetic retinopathy. The present sequence is the amino acid sequence of the novel isolated human protein 9389 of the invention.

                                                                                                                                                                                                                                                The invention discloses an isolated nucleic acid molecule encoding a C important in cholesterologenesis. The polynucleotide and polypeptide are useful as models for the development of human therapeutic targets, to aid development of human therapeutic proteins and as targets for the polypeptide in cells and tissues. The polynucleotide is useful for the polypeptide in cells and tissues. The polynucleotide is useful for monitoring the effectiveness of modulating compounds on the expression or cativity of the enzyme gene in clinical trials and in treatments, in diagnostic assays for qualitative changes in expression of enzyme nucleic such a mRNA, for testing an individual for a genotype and as a diagnostic tratter and the used to tailor treatment in an individual. The polypeptide is useful to raise antibodies, as a reagent in assays designed to quantitatively determine levels of the protein is compensated to the synthase subfamily, in drug screening assays, in pharmacogenomic analysis and for treating a disorder characterised by an absence of, inappropriate, or unwanted expression of the polypeptide. The general of the protein is the human HMG-COA synthase protein cDNA, the gene

                                The present invention relates to the isolation of a novel numan entry that shows a high degree of similarity to human cytoplasmic 3-hydroxy-3-12 methylglutaryl coenzyme A (HMG-CoA) synthase. The invention also discloses polynucleotide sequences encoding the novel enzyme of the invention. Both the polypeptide and polynucleotide sequences are useful as models for the development of human therapeutics, for identifying therapeutic proteins, as targets for development of human therapeutic agents, and as query sequences to perform a search against sequence capolypeptide is useful to raise antibodies or to elicit another immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as markers for tissues in which the corresponding protein is preferentially expressed, in drug screening assays, in cell-based or cell-free systems, to identify compounds that modulate synthase activity of the protein in its natural state, or an altered form that causes the specific disease or pathology associated with the synthase, to screen a compound for the ability to stimulate or inhibit interaction between the synthase protein and a molecule that normally interacts with the synthase protein, and in
                                                                                                                                                                                                                                                                                  WPI; 200

Novel human proteins and nucleic acid encoding the proteins, useful for diagnosis, treatment and prevention of disorders involving the human protein or nucleic acid e.g. cardiac and neurological disorders.

Claim 20; Page 245-246; 460pp; English.

The present invention describes isolated human NOVX proteins, where X is 1 to 42. ACC6236 to ACC62345 encode the human NOVX proteins given in ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiant, hypotensive, dermatological, anorectic, immunosuppressive, cytostatic, antiidiabetic, antiinfertility, haemostatic, netinflammatory, anti-HIV, antiparkinsonian and antilipaemic activities, and can be used in gene therapy. NOVX proteins are useful for treating or preventing a pathology associated with a NOVX protein in humans and for treating a syndrome associated with the human disease. NOVX nucleic acids, proteins and antibodies can be used in the treatment and diagnosis of cardiomyopathy, atherosclerosis, hypertension, congenital heart defects, aortic stenosis, valve disease, tuberous sclerosis, sclerosis, eclerosis, obesity, transplantation, congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic disease, neoplasm, lymphoma, uterus cancer, diabetes, metabolic disease, neoplasm, lymphoma, uterus cancer, fertility, haemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, graft versus host disease, AIDS, bronchial asthma, Crohn's disease, multiple sclerosis, latentopoletic disease, anorexia, cancer-associated cachexia, cancer, Alzheimer's disease, Parkinson's disease, immune disorders, haemophilia, haemophilia, cancer, and metabolic syndrome x. ACC62346 to ACC62465 represent PCR primers and probes for human NOVX sequences, which are used in examples from the present invention. The human NOV35b protein in the exemplification of the present invention with the human NOV35b protein in the exemplification of the present invention.
